

The Z-Series Composite Sills

COVERED ADJUSTMENT SCREWS

Dirt and water can get into the exposed screws of other adjustable sills. Our Z-Series sill has sealing plugs that hide unsightly screws and keep water and dirt away from the adjustment mechanism.

CRUCIAL CORNER

An improvement to the most susceptible area of a door. The weatherstrip stands off of the door, diverting running water away from the threshold cap and the high dam.

NARROW THRESHOLD CAP

Our synthetic cap is both decorative and durable. The color is molded into the material, not just an applied finish. It resists chipping and wear as well as being immune to rot. The narrow profile keeps it dry.

HIGH DAM TECHNOLOGY

An improved barrier to air driven water and added resistance to moisture penetration even in the most extreme weather conditions. Tested and proven, High Dam Technology can provide an exclusive advantage to your door.

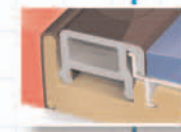

THE Z-SERIES DUAL SEAL

The unique dual seal of the Z-Series overlaps the dam and has a dual durometer seal to prevent any air and water infiltration.

ENHANCED THERMAL BREAK

Enhanced Thermal Break design inhibits thermal conductivity preventing moisture from penetrating into the home.

COMPOSITE SUBSTRATE

The Z-Series Sill can not warp. Our sill substrate material is a composite; it is impervious to water. It will not react to moisture and rot like wood.

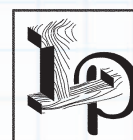

THE Z-SERIES ADVANTAGE

The Z-Series Synthetic Sill is the only product available today that allows the pre-hanger to maintain their own stock inventory of parts that can be reconfigured as needed. Build multiples, left lites, right lites, active and static panels and different size openings, all from the same sill inventory. Incorporating modular High Dam threshold design, durable warp and rot free materials with multiple air pocket construction. When used in combination with our complete line of door components it creates the very best system available.
